Office of Superfund
Waste Management Division
230 South Dearborn Street
Chicago, Illinois 60604

Dear Mr. Swale:

Enclosed are the revisions to the Wetlands delineation report for the American Chemical Services site in Griffith, Indiana, performed under IAG-DW14934313-0. An annotated list of revisions follows:

- 1) In response to BTAG coordinator's comments regarding Pg.4, Para. 1: The paragraph explaining the procedures used to draw the preliminary map has been expanded and merged with preceding paragraphs. Hopefully, this will clarify how the soil survey was utilized.
- 2) Disturbed conditions--During the field reconnaissance flagging visit the area was scanned for disturbed conditions. No disturbed areas were observed except for small clearings resulting from other remedial activities occurring at the site. This information has been incorporated into the report and is located on page 4, paragraph 1, last sentence.
- 3) Wetland hydrology--A paragraph has been included explaining how the criterion for wetland hydrology was determined to have been met. This is located on page 4, paragraph 2.
- 4) Soil comparisons to Color Chart--Due to extreme inclement weather and the obvious difference between the hydric and non-hydric soils, the samples were taken back to the office. As was mentioned in a telephone conversation between Robin Nims and you on August 6, 1990, the soil samples were retained. The representative soil samples will be forwarded to you for reference. Many of the samples are still moist after having been stored for 3 months.
- 5) Selection of Sampling Points--The rationale for selecting additional sampling areas to replace areas that did not meet the 3 mandatory technical criteria is elusive. The lack of the 3 criteria indicates that the area is not a wetland. Selecting additional areas would not have influenced the outcome of the survey.

6) Wetland Hydrology--Due to a misinterpretation of the field survey forms, FAC species were calculated into the percent hydrophytic vegetation calculations, while species that did not have an indicator category were omitted. This oversight has been corrected. Species that did not have indicator category listings have been assigned UPL listings as suggested. However, 2 species that are found only in water, that did not have category listings, were not assigned UPL categories and were left with the category of "NONE". These corrections have not affected the outcome of the survey; only 1 additional area was determined to be non-wetland due to lack of a predominance of hydrophytic vegetation. A discussion of this information is located on page 10, paragraph 2, under the heading of Wetland I.

7) Table 2--Table 2, located on page 11, has been revised with the recalculation of the percent hydrophytic vegetation. This criterion was calculated using percent OBL and FACW, versus FACU and UPL. The new figures are listed in the table. The wetland determination status of representative area Q₂ has changed from YES to NO.

8) Figure 5--A key has been added to Figure 5. Text has been added explaining how the final boundaries were drawn. Also, it is explained that no additional acreage was delineated. As stated in the introduction of the report there are approximately 50 acres comprising both Wetland I and Wetland II. This information can be found on page 9.

If you have additional questions regarding the report, or the contents of this letter, please contact Robin Nims of my staff at FTS 332-4269.

Sincerely yours,

A handwritten signature in black ink, appearing to read "David C. Hudak". The signature is fluid and cursive, with the first name "David" being the most prominent.

Summary

At the request of the U.S. Environmental Protection Agency, Region V, the U.S. Fish and Wildlife Service conducted a wetlands delineation for site wetlands potentially impacted by contaminants originating at the American Chemical Services (ACS) hazardous waste site.

Office review and field surveying indicated numerous wetlands exist at the ACS site, many of which are not identified on the National Wetland Inventory. The diversity of wetland types present provide habitat for a variety of wildlife species.

INTRODUCTION

The American Chemical Services (ACS) Superfund site is located in Griffith, Indiana on the outskirts of the city's southeast side. The site was placed on the National Priorities List in 1983 as a result of investigations into chemical disposal practices on the site. ACS operates as a chemical/solvent recovery facility, which also has a limited chemical manufacturing operation. During the course of its operations, ACS dumped and otherwise disposed of unrecoverable solvents on the property, in addition to transporting waste to the adjacent Griffith City Landfill. Kapica Drum, Inc. also allegedly disposed of drum-cleaning residues on ACS property. These 3 sites total 52 acres and jointly comprise the official ACS site.

The National Wetland Inventory (Figure 1) indicates numerous and extensive wetlands within a 1-mile radius of the ACS site to the southwest, south, southeast, east, and northeast. There is an extensive wetland complex adjacent to the northwest boundary of the site. These wetlands are dissected and bordered by the Grand Trunk Western Railroad lines, the Chesapeake and Ohio Railroad lines, and the abandoned Erie-Lackawanna Railroad lines. The wetlands to the north of the Grand Trunk Western lines were not within the project boundary limits, however, they are likely hydraulically connected. The NWI map classifies this wetland complex as palustrine, emergent, semi-permanent/palustrine emergent, seasonally flooded. The entire complex is approximately 78 acres, however, only 50.5 acres were included in the present delineation.

OBJECTIVES

The objectives of this project were:

1. To ground-truth and verify wetlands delineated on the National Wetland Inventory maps.
2. To identify other wetland areas not included in the National Wetland Inventory.
3. To identify dominant vegetation in the various wetland areas.
4. To assess relative value of the various wetland habitats for fish and wildlife resources.

METHODS

The methods utilized in this delineation are outlined in the Federal Manual for Identifying and Delineating Jurisdictional Wetlands (1989). Because of the relative homogeneity of the site, the soils assessment procedure was selected. Prior to the field work, an office review was conducted to preliminarily outline the area in question. Due to the unavailability of the most recent aerial photographs the preliminary boundaries were outlined from a 1984 photograph, obtained from the EPA project manager. Based upon the field inspection, the 1984 photograph was accurate with the exception of approximately 5 additional acres lost to the Griffith Landfill operation.

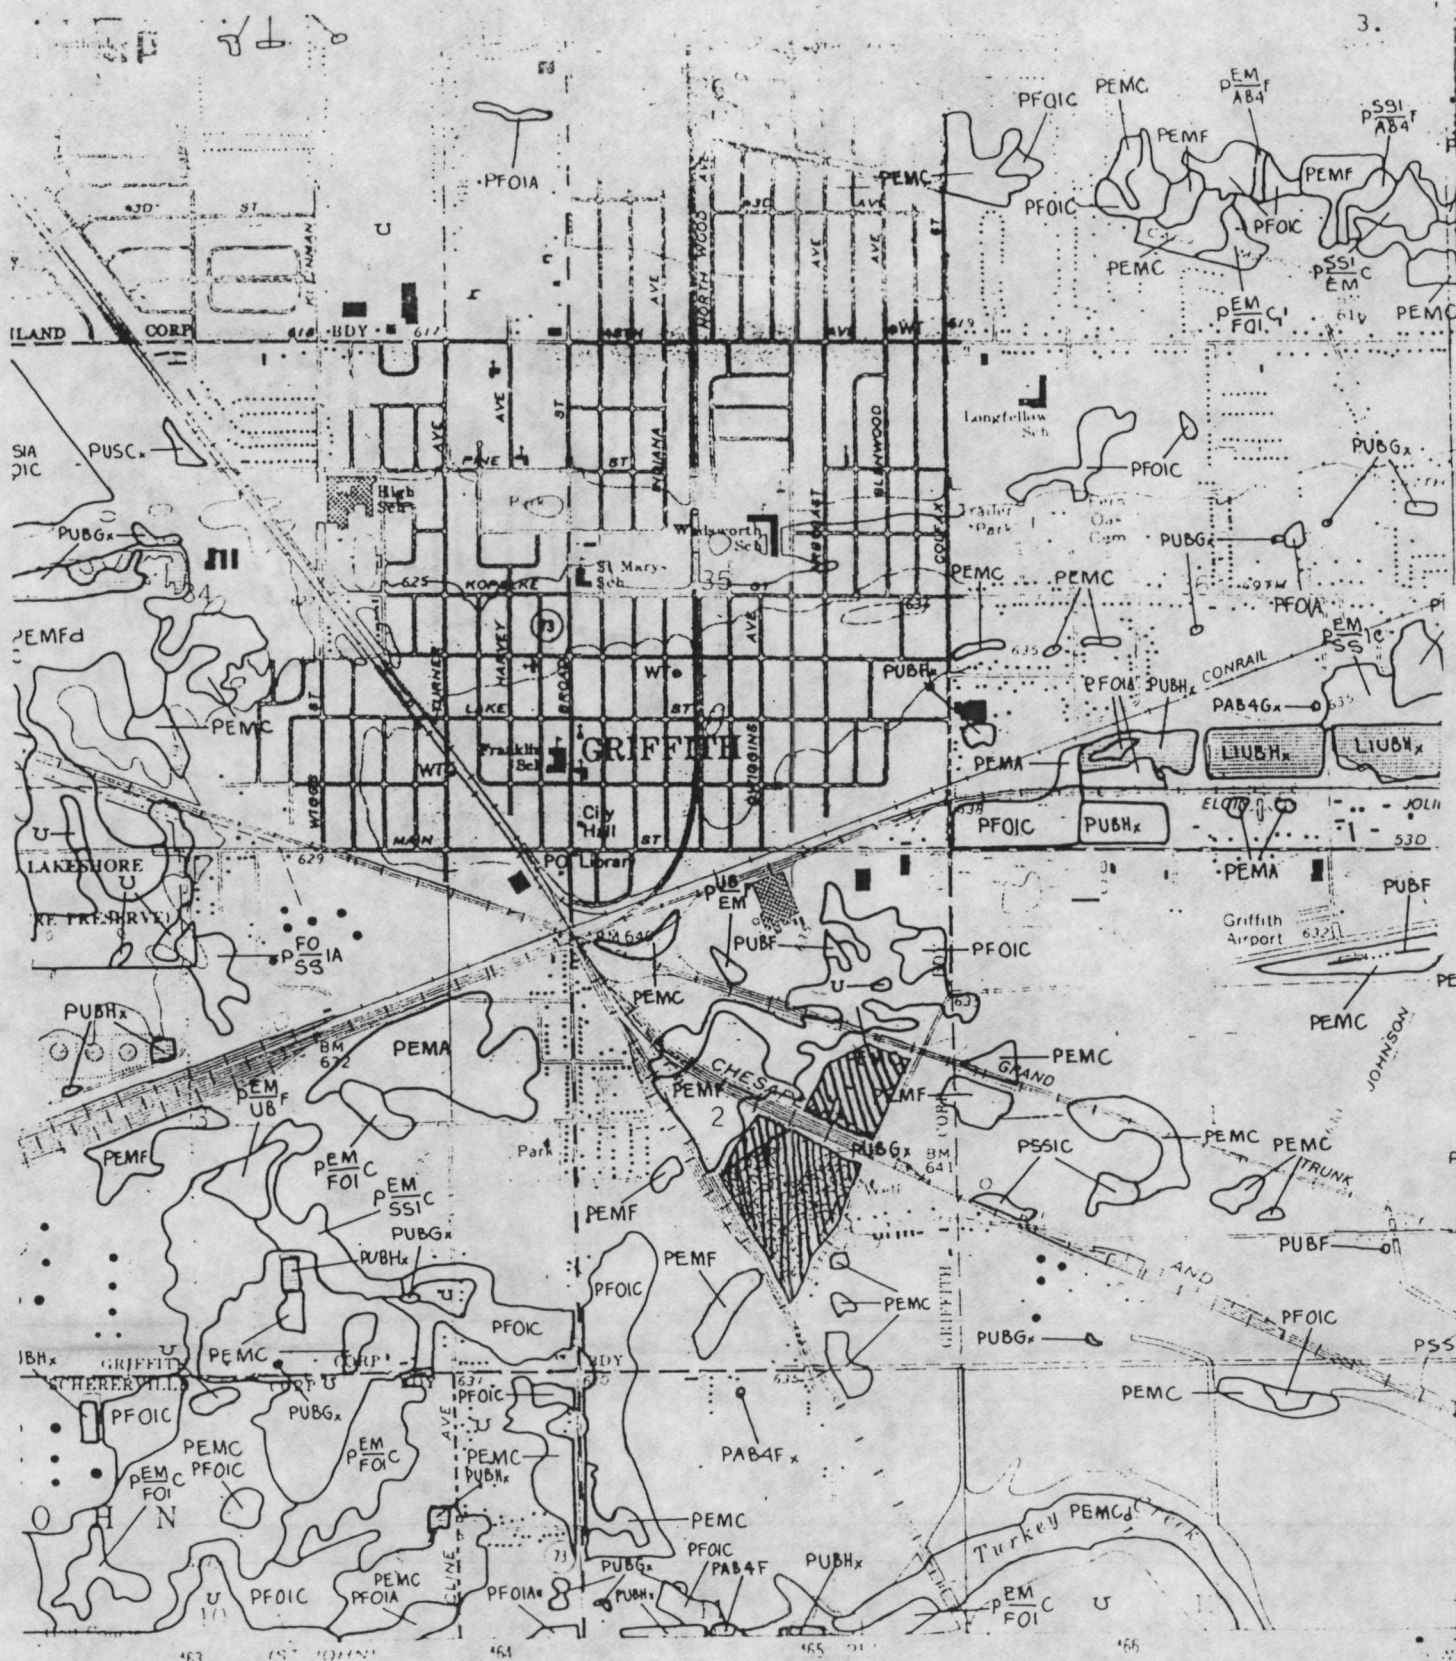

FIGURE 1. National Wetland Inventory map in the vicinity of the American Chemical Service site, Griffith, Indiana. USGS Highland Quadrangle. Cross-hatched area is ACS.

During the office review and map preparation a copy of the U.S. Soil Conservation Service Soil Survey for Lake County, Indiana (1972) was consulted to determine the presence or absence, and locations of hydric soils. The Lake County Indiana Survey sheet number 21 (Figure 2) indicates the majority of the area in question consists of Maumee loamy fine sand, interspersed with areas of Plainfield fine sand, Watseka loamy fine sand, and a small section of Tawas muck. The Maumee loamy fine sand and Tawas muck are classified by the U.S. Department of Agriculture and the Soil Conservation Service (1986) as hydric soils. The soil survey was used to compare soil types to the general configuration of the visual boundary of the wetlands on the aerial photograph. To avoid damaging the aerial photograph, a clear plastic overlay was attached and the information transcribed. Points along the visual perimeter of the wetland that coincided with the hydric soils boundaries were randomly selected and their compass bearings recorded to assist in field location. Location of the points were arbitrarily located from 88 to 282 feet apart based upon a scale of 1 inch (in) = 25 millimeters (mm) = 220 feet (ft), 1 mm = 8.8 ft. The preliminary map generated in the office (Figure 3) was used in the field reconnaissance flagging effort. In the field, point A was located on ground by its position relative to the railroad track embankment and the tree row in the upper northwest corner of the study area. Based upon the preliminary map, point B was located with the use of a Suunto MC-1 mirror compass and was measured off with a tape measure 220 feet S 66 E of point A. All other points were located and measured off in the same manner. Orange flags were placed at each point, and pink flags were placed every 55 feet to assist in maintaining the proper bearing alignment. During the flagging reconnaissance visit, no sign of disturbed conditions existed in the wetland areas with the exception of the railroad embankments that were placed through the wetlands, and minor disturbances such as small clearings for groundwater wells etc., resulting from other remedial investigation activities occurring at the site. An apparent illegal fill had occurred in the wetland located adjacent to the Griffith City Landfill.

During the reconnaissance flagging visit it was noted that the entire wetland area identified on the National Wetland Inventory either possessed standing water (up to 2.5 feet in some areas; 5 feet in the ditches), or water-logged saturated soils (water table at soil surface). Based upon these field observations it was determined that the hydrologic criteria for wetlands was met.

To aid in the identification of the different soil types in the field, the soil profiles for Maumee loamy fine sand and Plainfield fine sand were recorded (Table 1). Because the soil sample probes were taken to a depth of 18 inches, only the first 3 incremented intervals were noted. Soil samples were collected at each point with a 21 inch Hoffer Soil Sampler probe. Due to extreme inclement weather, and the strikingly obvious difference between the hydric and non-hydric soils, the soil samples were observed in the field and the lowest 3 inches were collected in whirl-pak bags for later comparisons to the Munsell Soil Color charts. Areas possessing standing water did not yield soil samples due to wash-out upon extraction of the probe. In these instances the whirl-pak bag containing the point location tags were transported back to the office empty.

Representative observation areas (Figure 4) were selected based upon several factors. In addition to selecting areas that met the hydric soil criterion, representative observation areas that had apparent characteristics, but were not identified on the National Wetland Inventory map were also chosen. The plant communities were characterized, and the percent areal cover of the dominant species

in the communities were visually estimated. Samples of the dominant vegetation at each of the representative areas were collected in 8 gallon plastic bags and transported to the office for later identification. A list of references used is included in Appendix 1. Once the vegetation was identified the information was recorded on field data forms and the indicator status of the species was obtained from the National List of Plant Species that occur in Wetlands; Indiana (1988). A wetland determination was then made for each representative observation area based upon the 3 mandatory technical criteria; hydrophytic vegetation, hydric soils, and wetland hydrology, as outlined in the Federal Manual for Identifying and Delineating Jurisdictional Wetlands. The information obtained in the survey was used to prepare the final map of the site wetlands. It is important to note that no "additional" wetlands have been delineated in terms of acreage. This study has examined wetlands currently shown on the National Wetland Inventory map, and differentiated between the existing habitat types that are not delineated on the NWI within the original boundaries. The wetland boundaries indicated on Figures 5 and 6 were drawn based upon visual field observations of shifts in dominant vegetation. All soils within the peripheral boundaries are hydric.

RESULTS AND DISCUSSION

Of the 21 representative observation areas sampled, 12 met all 3 mandatory technical criteria for wetland determination (Table 2). Of the 9 areas that failed the mandatory technical criteria test, M, N, S, D₂, and H₂ lacked all 3 criteria; C₂ and Q₂ lacked hydrophytic vegetation criteria; R¹ lacked hydric soil and hydrology criteria, and F₂ lacked wetland hydrology and hydrophytic vegetation criterion.

Wetland I

Wetland I is bounded by the Grand Trunk Western Railroad, the American Chemical Services site, and the Chesapeake and Ohio Railroad. Based upon the results of the survey this area is more complex than the National Wetland Inventory (NWI) indicates (Figure 5). NWI shows this area as consisting of a large palustrine, emergent, semi-permanent mixed with seasonally flooded wetland. The NWI does not show any of the forested or scrub-shrub wetlands bordering the palustrine emergent area. Of the 15 representative observation areas selected for Wetland I, the 5 that did not meet the technical criteria for wetland determination were all transitional zones between the wetland-upland interface. Non-hydric soils were present at 4 of the 5 areas. All of the areas possessed hydrophytic vegetation, but the percentage of FACU and UPL exceeded the percentage of FACW and OBL species at each of the 5 areas except R¹. It should be noted that some species were collected at the various areas that did not have indicator category designations; these species were not located in either the state or national list of plant species found in wetlands. It is sophistic to automatically list species not included on the National Plant List as UPL species, however, based upon reviewers suggestions this has been done with the exception of 2 species of liverworts: Riccia fluitans and Ricciocarpus natans. These two species are bryophytes which are found in the water; it would be completely erroneous to list these as UPL species.

Wetland II

Wetland II is bounded by the Chesapeake and Ohio Railroad, the City of Griffith landfill, and the abandoned Erie-Lackawanna Railroad bed. Wetland II, according to the NWI is a palustrine, emergent, semi-permanent wetland. The various other habitat types surrounding it have been omitted from the official map.

This wetland area has been impacted due to past and present expansion of the City of Griffith Landfill. Approximately 5 acres of emergent/scrub-shrub/forested wetland on the north and southeast corners have been filled since the 1984 aerial photograph was taken. There is also a gravel road/turn-around that appeared to have been recently laid in the center of the palustrine, emergent, seasonally flooded wetland (Figure 5). This was probably an illegal fill; the U.S. Army Corps of Engineers has been notified.

There were 4 representative observation areas that did not meet the 3 technical criteria for wetland designation. However, 3 areas were placed along the railroad embankment, due to the location of a drainage ditch (approximately 5 feet deep) lying between the railroad tracks and the wetland area to the south of the ditch. Additional representative areas were not selected to replace areas not meeting the 3 mandatory criteria, any additional points along the railroad embankment would yield

the same results. Technically, the entire area would be classified wetlands if the railroad tracks and embankments did not exist. The 4th area lacked a predominance of hydrophytic vegetation.

NATURAL RESOURCES

This field investigation indicated that the natural resources and natural resource values of the wetland habitats are greater than originally suspected because of the diversity of habitat types present: emergent, scrub-shrub, and forested.

The vegetation of "marshes" is characterized by emergent aquatic plants growing in permanent to semi-permanent shallow water. Also present are species of shallow open water communities, as well as those found in sedge meadows and seasonally flooded basins. Marshes are among the most productive of all wetlands for waterbirds and furbearers, and can also provide spawning and nursery habitat for many species of fish. Birds that use marshes for breeding and feeding include ducks, geese, rails, herons, egrets, terns, and many songbirds. Raptors such as the osprey, bald eagle, and northern harrier frequent marshes in search of prey. Important furbearers inhabiting marshes include beaver, muskrat, and mink. Excellent winter habitat can be provided for upland wildlife, including ring-necked pheasant and eastern cottontail (Eggers and Reed 1987).

The emergent wetlands in the centers of wetland areas I and II are predominated by cattails. A list of species collected can be found in Table 3. Cattail stands provide important food and cover for wildlife. For example, the rhizomes are eaten by geese and muskrats. Muskrats also use the foliage to construct their lodges, which in turn can provide resting and nesting sites for waterbirds. Yellow-headed blackbirds, red-winged blackbirds, and marsh wrens build their nests in cattail vegetation. Wetland area I contains an open water area with a muskrat den and much activity in this area was apparent.

The transitional zones between the emergent areas and shrubby or forest areas support hydrophytic vegetation on saturated but not inundated soils. Plants occurring in these areas include species found in other communities, such as the annuals of seasonally flooded basins, emergent aquatics of marshes, and invading shrubs or trees, which are present as scattered, small individuals.

The transitional emergent zones are particularly important for their water quality functions. Wildlife habitat is provided for many species including sandhill crane, ring-necked pheasant, common snipe, sedge wren, small mammals, and white-tailed deer. The composites found in these areas are an important fall and winter food source for songbirds.

Scrub-shrub wetlands are plant communities dominated by woody vegetation less than 20 feet in height and with dbh's of less than 6 inches growing on saturated to seasonally flooded soils. They can be dominated by willows and/or red-osier, and sometimes silky (swamp) dogwood. These areas usually retain some of the forbs, grasses, and sedges of the transitional emergent zones. The vegetation in scrub-shrub wetlands possesses a variety of wildlife value. Willows are browsed by white-tail deer and eastern cottontails; red-osier dogwoods provide berries for song birds and ruffed grouse and are browsed by deer and rabbits; and elderberry also provides berries for songbirds and ruffed grouse.

Forested wetlands are dominated by mature conifers or lowland hardwood trees. They

are important for stormwater and flood retention, and also provide habitat for white-tailed deer, furbearers, songbirds, ruffed grouse, barred owl, and amphibians. The various wetland habitats at the American Chemical Services site are being used by a variety of wildlife species, many of which were observed during the reconnaissance flagging visit, and the field survey visit (Table 4).

ADDITIONAL WETLANDS

At a meeting held by the U.S. EPA project manager on February 28, 1990, FWS was requested to observe the area immediately east of American Chemical Services, adjacent to Colfax Road to determine if wetlands were present. This area was walked during the field reconnaissance flagging visit, which revealed various wetlands, some of which were not indicated on the NWI maps (Figure 6). There is a palustrine, emergent, semi-permanent wetland approximately 7 acres in size about 0.1 mile east of Colfax Road, that is identified on the NWI map. The field check revealed that this wetland extends west and southward within 20-30 feet of the roadway. These wetlands would be classified as a combination palustrine, emergent/scrub-shrub forested area with water regimes ranging between temporary, saturated, seasonal, seasonal saturated, and semi-permanent.

A wetland delineation was not conducted for this area, however, the soil survey maps indicate that portions do contain hydric soils.

ENDANGERED SPECIES

The Highland area of Lake County is represented by many federal and state species of special emphasis/concern, in addition to several federal threatened and endangered species. An annotated list follows:

Fed E	Indiana bat	<u>Myotis sodalis</u>
Fed E	Peregrine falcon	(<u>Falco peregrinus</u>) *Migratory
Fed T	Pitchers thistle	(<u>Cirsium pitcheri</u>)
Sp EM/CN	Great blue heron	(<u>Ardea herodias</u>)
	American bittern	(<u>Botaurus lentiginosus</u>)
	Black tern	(<u>Chlidonis niger</u>)
	Least bittern	(<u>Ixobrychus exilis</u>)
	King rail	(<u>Rallus elegans</u>)
	Yellow-crowned night heron	(<u>Nycticorax violaceus</u>)
	Spotted turtle	(<u>Clemmys guttata</u>)
	Western smooth green snake	(<u>Opheodrys vernalis</u>)
	Franklin's ground squirrel	(<u>Spermophilus franklini</u>)
	Blanding's turtle	(<u>Emydoidea blandingi</u>)
	Bald eagle	(<u>Haliaeetus leucocephalus</u>) *Historical

This endangered species list constitutes informal consultation only, and is not intended to fulfill the requirement of Section 7 of the Endangered Species Act of 1973, as amended. If, after review of the Phase I Remedial Investigation report, it appears likely that any endangered species may have been/may be affected by this site, it may be necessary to initiate formal consultation. If as a result of further consultation, a "no effect" determination is made regarding endangered species, that determination should be revisited after 1 year for new information, or newly listed species.

<u>Sylvilagus floridanus</u>	Eastern cottontails (4)

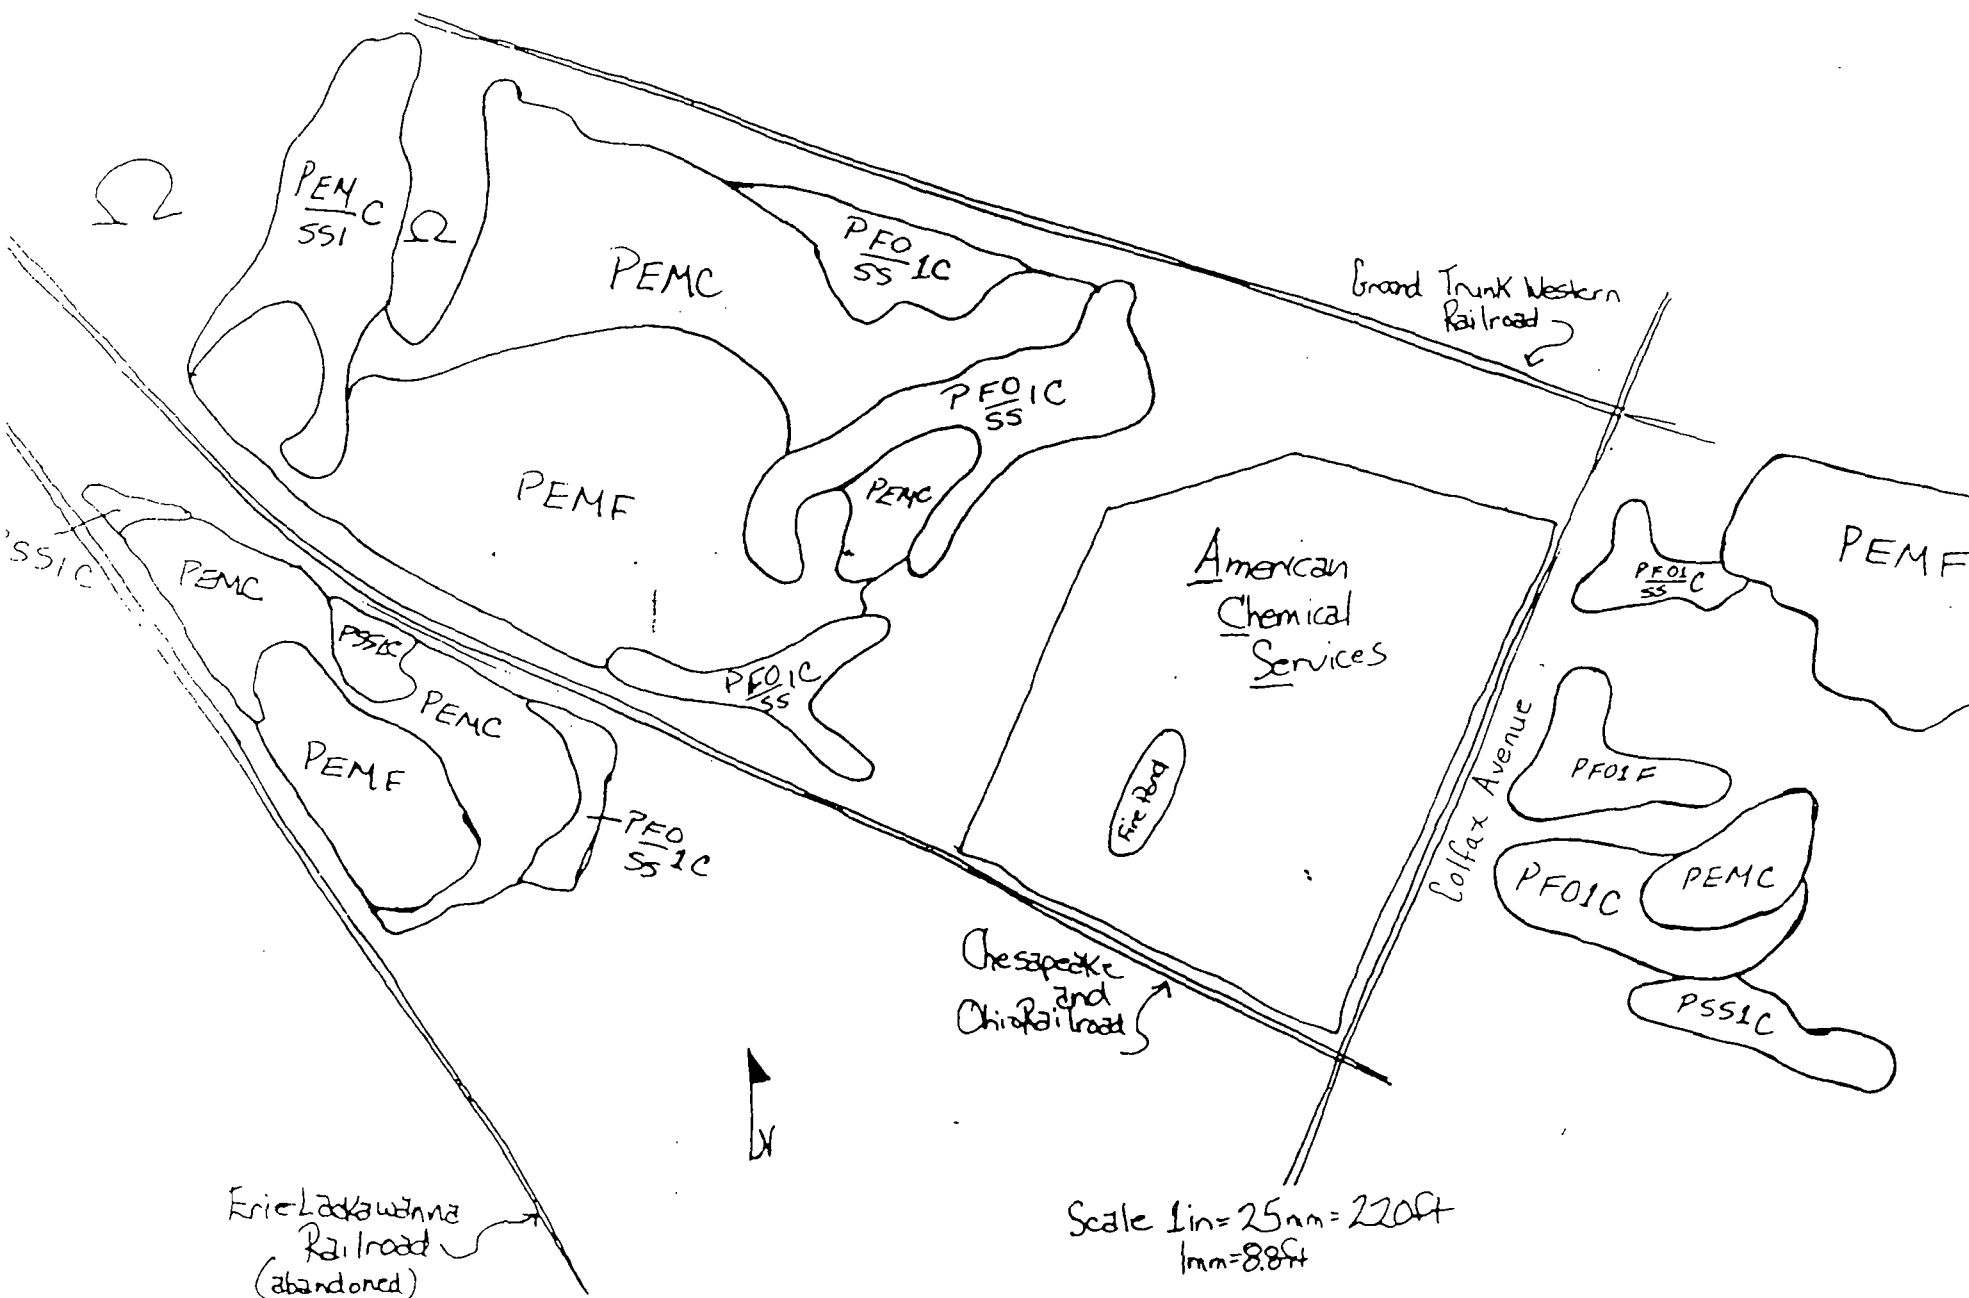

FIGURE 6. Approximate locations and classifications of additional wetlands located near the ACS site, east across Colfax Avenue, Griffith, Indiana.

CONCLUSIONS

1. Wetlands identified on the NWI do exist at the American Chemical Services site.
2. There are wetlands present at the site that are not identified on the NWI. These wetlands consist of palustrine, forested, and scrub-shrub transitional zones between the NWI-identified emergent wetland and upland areas.
3. The wetlands present at the site provide habitat diversity for a variety of wildlife species.
4. The wetlands present on the site possess potential habitat for federal threatened and endangered species, state and federal species of special concern/emphasis, and other birds protected by the Migratory Bird Treaty Act.

APPENDIX 2
Field Data Forms

**DATA FORM
ROUTINE ONSITE DETERMINATION METHOD¹**

Field Investigator(s): R. NIMS / K. Fuller Date: April 11, 1990
 Project/Site: AGS State: IN County: LAKE
 Applicant/Owner: EPA Plant Community #/Name: A
 Note: If a more detailed site description is necessary, use the back of data form or a field notebook.

Do normal environmental conditions exist at the plant community?

Yes ☒ No ☐ (If no, explain on back)

Has the vegetation, soils, and/or hydrology been significantly disturbed?

Yes ☐ No ☒ (If yes, explain on back)

VEGETATION

Dominant Plant Species		Indicator Status	Stratum	Dominant Plant Species		Indicator Status	Stratum
1.	<u>Quercus Alba</u>	<u>FACU</u>		11.			
2.	<u>Quercus Velutina</u>	<u>None</u>		12.			
3.	<u>Cornus Amomum</u>	<u>FACW+</u>		13.			
4.	<u>Quercus Pauciflora</u>	<u>FACW+</u>		14.			
5.	<u>Oxalis Serotina</u>	<u>FACU</u>		15.			
6.	<u>Najas aquatica</u>	<u>FACW+ (Not)</u>		16.			
7.	<u>Cladonia palustris</u>	<u>FACW</u>		17.			
8.	<u>Yucca utilis</u>	<u>FAC+</u>		18.			
9.	<u>Asplenium parviflorum</u>	<u>FAC+</u>		19.			
10.				20.			

Percent of dominant species that are OBL, FACW, and/or FAC 87.5%

Is the hydrophytic vegetation criterion met? Yes ☒ No ☐

Rationale:

yes

SOILS

Series/phase: Mauvois / fine sand Subgroup: Typic Haplagolls

Is the soil on the hydric soils list? Yes ☒ No ☐ Undetermined ☐

Is the soil a Histosol? Yes ☐ No ☒ Histic epipedon present? Yes ☐ No ☐

Is the soil: Mottled? Yes ☐ No ☒ Gleyed? Yes ☐ No ☐

Matrix Color: N2/O Black Mottle Colors:

Other hydric soil indicators: Saturated

Is the hydric soil criterion met? Yes ☒ No ☐

Rationale: It meets the minimum requirements.

yes

HYDROLOGY

Is the ground surface inundated? Yes ☐ No ☒ Surface water depth:

Is the soil saturated? Yes ☒ No ☐

Depth to free-standing water in pit/soil probe hole:

List other field evidence of surface inundation or soil saturation.

yes

Is the wetland hydrology criterion met? Yes ☒ No ☐

Rationale:

JURISDICTIONAL DETERMINATION AND RATIONALE

Is the plant community a wetland? Yes ☐ No ☐

Rationale for jurisdictional decision:

¹ This data form can be used for the Hydric Soil Assessment Procedure and the Plant Community Assessment Procedure

² Classification according to "Soil Taxonomy."

**DATA FORM
ROUTINE ONSITE DETERMINATION METHOD¹**

Field Investigator(s): R. Nims Date: _____
 Project/Site: ACS State: IN County: LAKE

Summary

At the request of the U.S. Environmental Protection Agency, Region V, the U.S. Fish and Wildlife Service conducted a wetlands delineation for site wetlands potentially impacted by contaminants originating at the American Chemical Services (ACS) hazardous waste site.

Office review and field surveying indicated numerous wetlands exist at the ACS site, many of which are not identified on the National Wetland Inventory. The diversity of wetland types present provide habitat for a variety of wildlife species.

INTRODUCTION

The American Chemical Services (ACS) Superfund site is located in Griffith, Indiana on the outskirts of the city's southeast side. The site was placed on the National Priorities List in 1980 as a result of investigations into chemical disposal practices on the site. ACS operates as a chemical/solvent recovery facility, which also has a limited chemical manufacturing operation. During the course of its operations, ACS dumped and otherwise disposed of unrecoverable solvents on the property, in addition to transporting waste to the adjacent Griffith City Landfill. Kapica Drum, Inc. also allegedly disposed of drum-cleaning residues on ACS property. These 3 sites total 52 acres and jointly comprise the official ACS site.

The National Wetland Inventory (Figure 1) indicates numerous and extensive wetlands within a 1-mile radius of the ACS site to the southwest, south, southeast, east, and northeast. There is an extensive wetland complex adjacent to the northwest boundary of the site. These wetlands are dissected and bordered by the Grand Trunk Western Railroad lines, the Chesapeake and Ohio Railroad lines, and the abandoned Erie-Lackawanna Railroad lines. The wetlands to the north of the Grand Trunk Western lines were not within the project boundary limits, however, they are likely hydraulically connected. The NWI map classifies this wetland complex as palustrine, emergent, semi-permanent/plaustine emergent, seasonally flooded. The entire complex is approximately 78 acres, however, only 50.5 acres were included in the present delineation.

OBJECTIVES

The objectives of this project were:

1. To ground-truth and verify wetlands delineated on the National Wetland Inventory maps.
2. To identify other wetland areas not included in the National Wetland Inventory.
3. To identify dominant vegetation in the various wetland areas.
4. To assess relative value of the various wetland habitats for fish and wildlife resources.

METHODS

The methods utilized in this delineation are outlined in the Federal Manual for Identifying and Delineating Jurisdictional Wetlands (1989). Because of the relative homogeneity of the site, the soils assessment procedure was selected. Prior to the field work, an office review was conducted to preliminarily outline the area in question. Due to the unavailability of the most recent aerial photographs the preliminary boundaries were outlined from a 1984 photograph, obtained from the EPA project manager. Based upon the field inspection, the 1984 photograph was accurate with the exception of approximately 5 additional acres lost to the Griffith Landfill operation.

To transfer information from the aerial photograph, a clear plastic overlay was attached and the information transcribed. Points along the visual perimeter of the wetland were randomly selected and their compass bearings recorded to assist in field location. Location of the points followed the general contour of the visual perimeter and were arbitrarily located from 88 to 282 feet apart based upon a scale of 1 inch (in) = 25 millimeters (mm) = 220 feet (ft), 1 mm = 8.8 ft.

The preliminary map generated in the office (Figure 2) was used in the field reconnaissance flagging effort. In the field, point A was located on ground by its position relative to the railroad track embankment and the tree row in the upper northwest corner of the study area. Based upon the preliminary map, point B was located with the use of a Suunto MC-1 mirror compass and was measured off with a tape measure 220 feet S 66 E of point A. All other points were located and measured off in the same manner. Orange flags were placed at each point, and pink flags were placed every 55 feet to assist in maintaining the proper bearing alignment.

During the office review and map preparation a copy of the U.S. Soil Conservation Service Soil Survey for Lake County, Indiana (1972) was consulted to determine the presence or absence, and locations of hydric soils. The Lake County Indiana Survey sheet number 21 (Figure 3) indicates the majority of the area in question consists of Maumee loamy fine sand, interspersed with areas of Plainfield fine sand, Watseka loamy fine sand, and a small section of Tawas muck. The Maumee loamy fine sand and Tawas muck are classified by the U.S. Department of Agriculture and the Soil Conservation Service (1986) as hydric soils. To aid in the identification of the different soil types in the field, the soil profiles for Maumee loamy fine sand and Plainfield fine sand were recorded (Table 1). Because the soil sample probes were taken to a depth of 18 inches, only the first 3 incremented intervals were noted. Soil samples were collected at each point with a 21 inch Hoffer Soil Sampler probe. The soil samples were observed in the field and the lowest 3 inches were collected in whirl-pak bags for later comparisons to the Munsell Soil Color charts. Areas possessing standing water did not yield soil samples due to wash-out upon extraction of the probe. In these instances the whirl-pak bag containing the point location tags were transported back to the office empty.

Representative observation areas (Figure 4) were selected based upon several factors. In addition to selecting areas that met the hydric soil criterion, representative observation areas that had apparent characteristics, but were not identified on the National Wetland Inventory map were also chosen. The plant communities were characterized, and the percent areal cover of the dominant species in the communities were visually estimated. Samples of the dominant vegetation at each of the representative areas were collected in 8 gallon plastic bags and transported to the office for later identification. A list of references used is included in Appendix 1. Once the vegetation was identified the information was recorded on field data forms and the indicator status of the species was obtained from the National List of Plant Species that occur in Wetlands; Indiana (1988). A wetland determination was then made for each representative observation area based upon the 3 mandatory technical criteria; hydrophytic vegetation, hydric soils, and wetland hydrology, as outlined in the Federal Manual for Identifying and Delineating Jurisdictional Wetlands. The information obtained in the survey was used to prepare the final map of the site wetlands.

FIGURE 3. U.S. Soil Conservation Survey-Lake County. Plate number 21. Cross-hatched area is ACS. Shaded areas are hydric soils.

Table 1. Typical, Profiles for Maumee loamy fine sand (Hydric) and Plainfield fine sand (Non-hydric) in Lake County, Indiana.

Maumee loamy fine sand			Plainfield fine sand		
Depth	Color	Munsell Notation	Depth	Color	Munsell Notation
0-9 inches	Black	N 2/0	0-4 inches	Dark Grey	10 YR. 3/1
16 inches	Black	N 2/0	4-6 inches	Greyish brown	10 YR. 4/2
16-21 inches	Black	N 2/0	6-27 inches	Yellowish brown	10 YR. 5/4

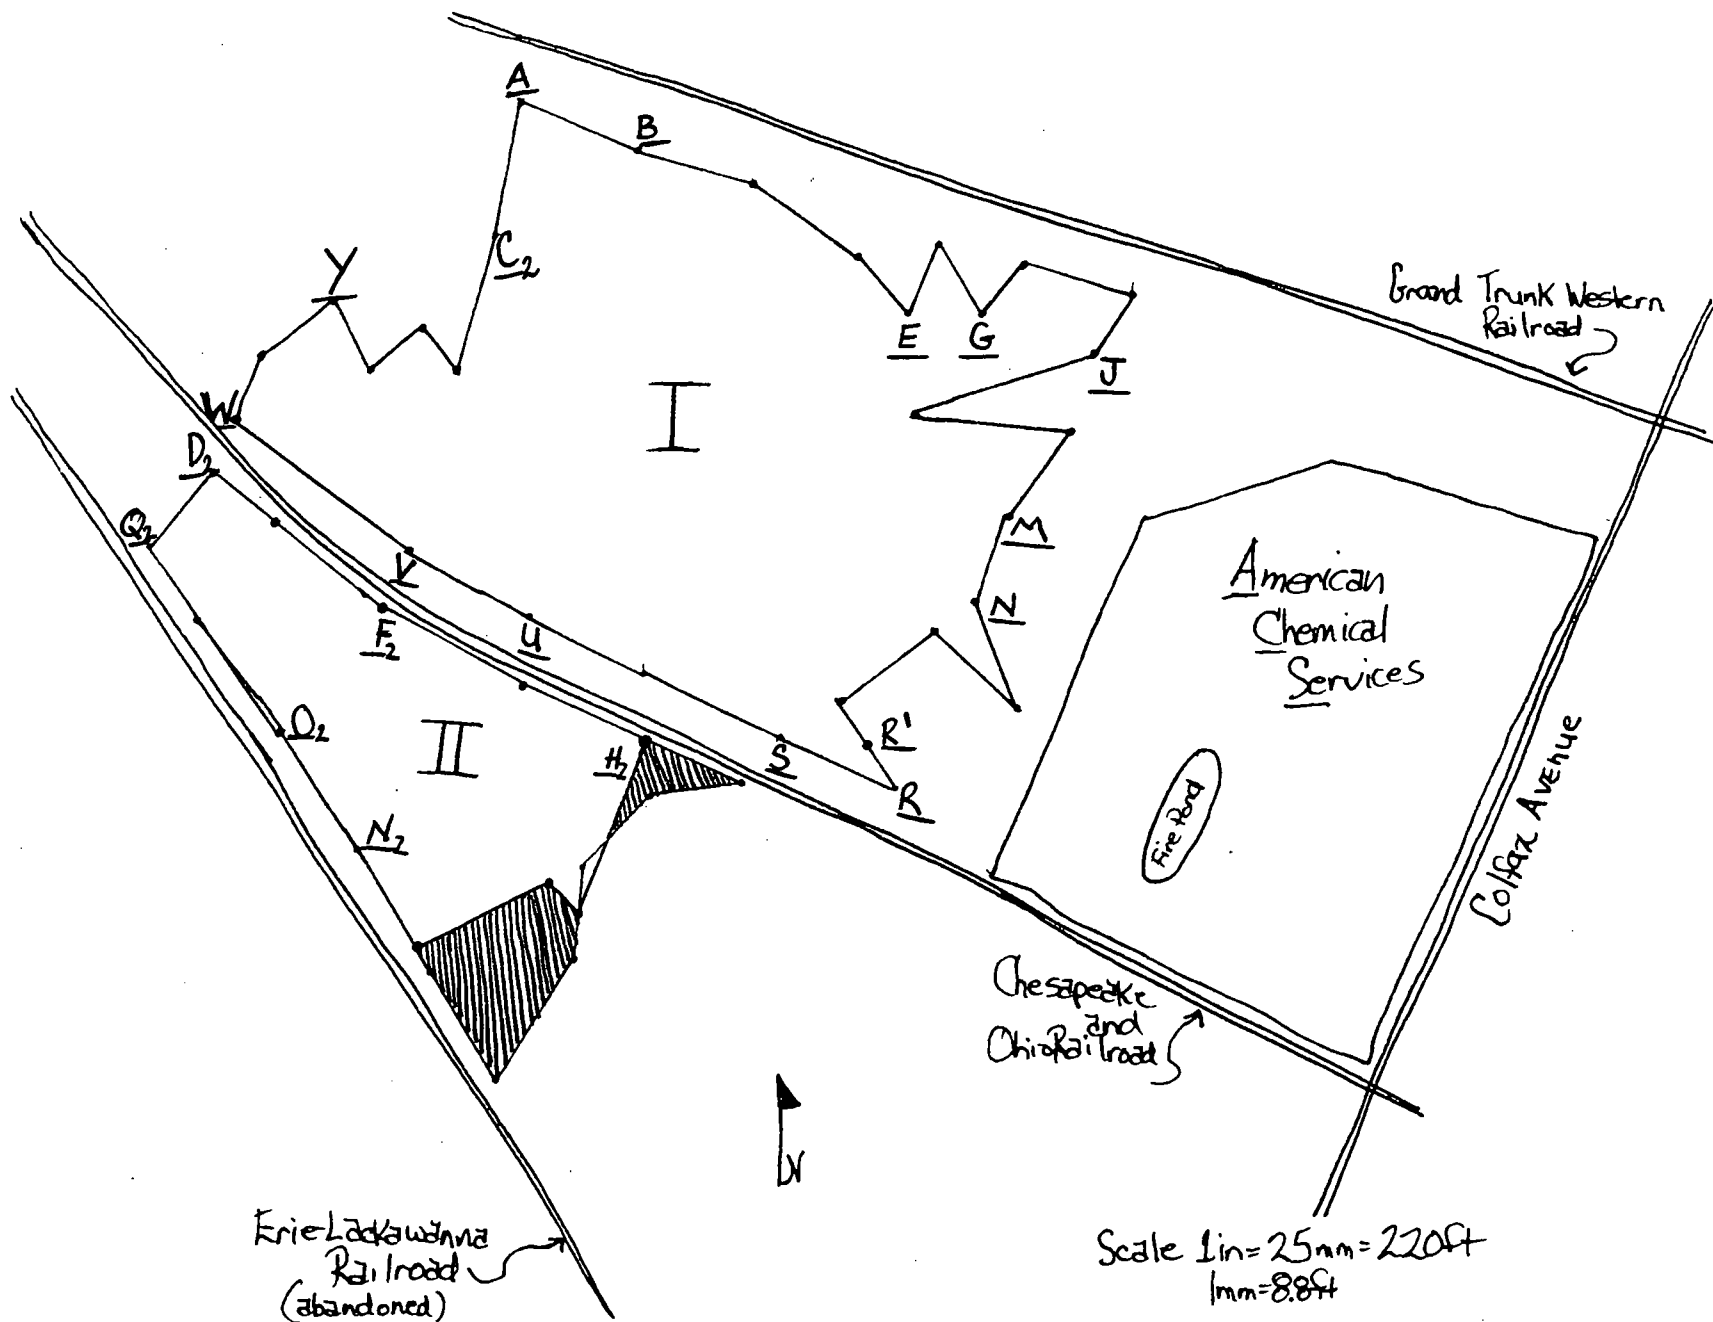

FIGURE 4. Representative observation areas for vegetation sampling. Cross-hatched area lost to landfill expansion.[∞]

RESULTS AND DISCUSSION

Of the 21 representative observation areas sampled, 13 met all 3 mandatory technical criteria for wetland determination (Table 2). Of the 8 areas that failed the mandatory technical criteria test, N and H₂ lacked all 3 criteria; M, R, S, and D₂ lacked the hydric soils and wetland hydrology criteria; C₂ lacked hydrophytic vegetation criteria; and F₂ lacked wetland hydrology criterion.

Wetland I

Wetland I is bounded by the Grand Trunk Western Railroad, the American Chemical Services site, and the Chesapeake and Ohio Railroad. Based upon the results of the survey this area is more complex than the National Wetland Inventory (NWI) indicates (Figure 5). NWI shows this area as consisting of a large palustrine, emergent, semi-permanent mixed with seasonally flooded wetland. The NWI does not show any of the forested or scrub-shrub wetlands bordering the palustrine emergent area. Of the 5 representative observation areas that did not meet the technical criteria for wetland determination all were transitional zones between the wetland-upland interface because of the presence of non-hydric soils at 4 of the 5 areas. All of the areas possessed hydrophytic vegetation, but the percentage of FACU and UPL exceeded the percentage of FAC, FACW, and OBL species only at area N. It should be noted that some species were collected at the various areas that did not have indicator category designations; these species were not calculated into the percentages.

Wetland II

Wetland II is bounded by the Chesapeake and Ohio Railroad, the City of Griffith landfill, and the abandoned Erie-Lackawanna Railroad bed. Wetland II, according to the NWI is a palustrine, emergent, semi-permanent wetland. The various other habitat types surrounding it have been omitted from the official map.

This wetland area has been impacted due to past and present expansion of the City of Griffith Landfill. Approximately 5 acres of emergent/scrub-shrub/forested wetland on the north and southeast corners have been filled since the 1984 aerial photograph was taken. There is also a gravel road/turn-around that appeared to have been recently laid in the center of the palustrine, emergent, seasonally flooded wetland (Figure 5). This was probably an illegal fill; the U.S. Army Corps of Engineers has been notified.

There were 3 representative observation areas that did not meet the 3 technical criteria for wetland designation. These 3 areas, however, were placed along the railroad embankment, due to the location of a drainage ditch (approximately 5 feet deep) lying between the railroad tracks and the wetland area to the south of the ditch.

NATURAL RESOURCES

This field investigation indicated that the natural resources and natural resource values of the wetland habitats are greater than originally suspected because of the diversity of habitat types present: emergent, scrub-shrub, and forested.

Table 2. Results of the technical criteria test for 21 representative observation areas at the ACS site, Griffith, Indiana.

Area	Soil Series	Hydrophytic Vegetat % OBL, FACW, FAC	Hydric Soil		Wetland Hydrology		Wetland Determination	
			Yes	No	Yes	No	Yes	No
A	Maumee loamy fine sand	85.5	X		X		X

Q ₂	Maumee loamy fine sand	60.0	X		X		X	

The vegetation of "marshes" is characterized by emergent aquatic plants growing in permanent to semi-permanent shallow water. Also present are species of shallow open water communities, as well as those found in sedge meadows and seasonally flooded basins. Marshes are among the most productive of all wetlands for waterbirds and furbearers, and can also provide spawning and nursery habitat for many species of fish. Birds that use marshes for breeding and feeding include ducks, geese, rails, herons, egrets, terns, and many songbirds. Raptors such as the osprey, bald eagle, and northern harrier frequent marshes in search of prey. Important furbearers inhabiting marshes include beaver, muskrat, and mink. Excellent winter habitat can be provided for upland wildlife, including ring-necked pheasant and eastern cottontail (Eggers and Reed 1987).

The emergent wetlands in the centers of wetland areas I and II are predominated by cattails. A list of species collected can be found in Table 3. Cattail stands provide important food and cover for wildlife. For example, the rhizomes are eaten by geese and muskrats. Muskrats also use the foliage to construct their lodges, which in turn can provide resting and nesting sites for waterbirds. Yellow-headed blackbirds, red-winged blackbirds, and marsh wrens build their nests in cattail vegetation. Wetland area I contains an open water area with a muskrat den and much activity in this area was apparent.

The transitional zones between the emergent areas and shrubby or forest areas support hydrophytic vegetation on saturated but not inundated soils. Plants occurring in these areas include species found in other communities, such as the annuals of seasonally flooded basins, emergent aquatics of marshes, and invading shrubs or trees, which are present as scattered, small individuals.

The transitional emergent zones are particularly important for their water quality functions. Wildlife habitat is provided for many species including sandhill crane, ring-necked pheasant, common snipe, sedge wren, small mammals, and white-tailed deer. The composites found in these areas are an important fall and winter food source for songbirds.

Scrub-shrub wetlands are plant communities dominated by woody vegetation less than 20 feet in height and with dbh's of less than 6 inches growing on saturated to seasonally flooded soils. They can be dominated by willows and/or red-osier, and sometimes silky (swamp) dogwood. These areas usually retain some of the forbs, grasses, and sedges of the transitional emergent zones. The vegetation in scrub-shrub wetlands possesses a variety of wildlife value. Willows are browsed by white-tail deer and eastern cottontails; red-osier dogwoods provide berries for song birds and ruffed grouse and are browsed by deer and rabbits; and elderberry also provides berries for songbirds and ruffed grouse.

Forested wetlands are dominated by mature conifers or lowland hardwood trees. They are important for stormwater and flood retention, and also provide habitat for white-tailed deer, furbearers, songbirds, ruffed grouse, barred owl, and amphibians. The various wetland habitats at the American Chemical Services site are being used by a variety of wildlife species, many of which were observed during the reconnaissance flagging visit, and the field survey visit (Table 4).

ADDITIONAL WETLANDS

At a meeting held by the U.S. EPA project manager on February 28, 1990, FWS was requested to observe the area immediately east of American Chemical Services,

Table 3. List of Vegetation Species collected on April 10-11, 1990 at the ACS site, Griffith, Indiana.

Scientific Name	Common Name	Indicator Category
<u>Agrimonia parviflora</u>	Agrimony	FAC+
<u>A. pubescens</u>	Agrimony	None
<u>Ampelopsis arborea</u>	Peppervine	None
<u>Apocynum androsaemifolium</u>	Spreading dogbane	None
<u>Aronia arbutifolia</u>	Red chokeberry	None
<u>Betula allegheniensis</u>	Yellow birch	FAC
<u>Chelidonium palustris</u>	Marsh marigold	OBL
<u>C. latifolium occidentale</u>	Hackberry	FAC-
<u>Cornus amomum</u>	Swamp dogwood	FACW+
<u>C. stolonifera</u>	Red-osier dogwood	FACW
<u>Corylus americana</u>	Hazelnut	FACU
<u>Cytisus scoparius</u>	Scotch broom	None
<u>Dipsacus sylvestris</u>	Teasel	None
<u>Fragaria virginiana</u>	Common Strawberry	FAC
<u>Galium aparine</u>	Bedstraw	FACU
<u>Hamamelis virginiana</u>	Witch hazel	FACU
<u>Liquidambar styraciflua</u>	Sweet Gum	FACW
<u>Ludwigia glandulosa</u>	Ludwigia	OBL
<u>Lyriodendron tulipifera</u>	Tuliptree	FACU+
<u>Nyssa sylvatica</u>	Tupelo	FACW+
<u>Onoclea sensibilis</u>	Sensitive fern	FACW
<u>Populus deltoides</u>	Cottonwood	FAC+
<u>P. grandidentata</u>	Large-tooth Poplar	FACU
<u>P. tremoides</u>	Quaking Aspen	FAC
<u>Prunus pennsylvanica</u>	Pin cherry	FACU
<u>Pteris esculenta</u>	Bracken fern	FACU
<u>Quercus alba</u>	White oak	FACU
<u>Q. bicolor</u>	Swamp white oak	FACW+
<u>Q. coccinea</u>	Scarlet oak	None
<u>Q. palustris</u>	Pin oak	FACW
<u>Q. rubra</u>	Northern red oak	FACU
<u>Q. velutina</u>	Black oak	None
<u>Rhus copellina</u>	Dwarf sumac	None
<u>Riccia fluitans</u>	Liverwort	None
<u>Ricciocarpus natans</u>	Liverwort	None
<u>Rosa carolina</u>	Wild rose	FACU-
<u>R. multiflora</u>	Multi-flora rose	FACU
<u>R. nitida</u>	Northeastern rose	None
<u>Rubus allegheniensis</u>	Highbush blackberry	FACU+
<u>R. canadensis</u>	Smooth blackberry	None
<u>R. hispidus</u>	Swamp dewberry	FACW
<u>R. villosa</u>	Low blackberry	None
<u>Salix discolor</u>	Pussy willow	FACW
<u>S. exigua</u>	Sandbar willow	OBL

<u>Scientific Name</u>	<u>Common Name</u>	<u>Indicator Category</u>
<u>Sambucus canadensis</u>	Elderberry	FACW-
<u>Solidago altissima</u>	Golden rod	FACU
<u>Sonchus arvensis</u>	Field sow-thistle	FAC-
<u>Spiraea alba</u>	Meadow sweet	FACW+
<u>S. latifolia</u>	Meadow sweet	None
<u>Stenanthium gramineum</u>	Featherbells	FAC
<u>Thelypteris thelypteroides</u>	Marsh fern	FACW
<u>Typha angustifolia</u>	Narrow-leaf cattail	OBL
<u>latifolia</u>	Broad-leaf cattail	OBL
<u>Ulmus rubra</u>	Slippery elm	FAC
<u>Verbascum thaspus</u>	Wooly mullein	None
<u>Verbena urticifolia</u>	White vervain	FAC+
<u>Viburnum prunifolium</u>	Black haw	FACU
<u>Vitis aestivalis</u>	Summer grape	FACU
<u>V. vulpina</u>	Frost grape	FACW-
<u>Xanthorhiza simplissima</u>	Yellowroot	None

Table 4. List of wildlife species observed utilizing the wetland habitats at the American Chemical Services site, Griffith, Indiana April 10-11, 1990.

Scientific Name	Common Name
BIRDS	
<u>Agelaius phoeniceus</u>	Red-winged blackbirds (many)
<u>Aix sponsa</u>	Wood ducks (1 pair)
<u>Anas platyrhynchos</u>	Mallard ducks (2 pairs)
<u>Branta canadensis</u>	Canada geese (1 pair)
<u>Charadrius vociferus</u>	Killdeer (1)
<u>Corvus brachyrhynchos</u>	Common crows (many)
<u>Dendrocopos pubescens</u>	Downy woodpeckers (2)
<u>D. villosa</u>	Hairy woodpeckers (1)
<u>Larus spp.</u>	Gulls (many)
<u>Phasianus colchicus</u>	Ring-necked pheasant (1 male)
<u>Regulus satrapa</u>	Golden-crown kinglets (2)
<u>Richmondia cardinalis</u>	Cardinals (3)
<u>Spinus tristis</u>	American goldfinches (1 pair)
MAMMALS	
<u>Procyon lotor</u>	Raccoon (tracks)
<u>Odocoileus virginianus</u>	White-tailed deer (tracks)
<u>Ondatra zibethicus</u>	Muskrats (3) & den
<u>Sylvilagus floridanus</u>	Eastern cottontails (4)

adjacent to Colfax Road to determine if wetlands were present. This area was walked during the field reconnaissance flagging visit, which revealed various wetlands, some of which were not indicated on the NWI maps (Figure 6). There is a palustrine, emergent, semi-permanent wetland approximately 7 acres in size about 0.1 mile east of Colfax Road, that is identified on the NWI map. The field check revealed that this wetland extends west and southward within 20-30 feet of the roadway. These wetlands would be classified as a combination palustrine, emergent/scrub-shrub forested area with water regimes ranging between temporary, saturated, seasonal, seasonal saturated, and semi-permanent.

A wetland delineation was not conducted for this area, however, the soil survey maps indicate that portions do contain hydric soils.

ENDANGERED SPECIES

The Highland area of Lake County is represented by many federal and state species of special emphasis/concern, in addition to several federal threatened and endangered species. An annotated list follows:

Fed E	Indiana bat	<u>Myotis sodalis</u>
Fed E	Peregrine falcon	(<u>Falco peregrinus</u>) *Migratory
Fed T	Pitchers thistle	(<u>Cirsium pitcheri</u>)
Sp EM/CN	Great blue heron	(<u>Ardea herodias</u>)
	American bittern	(<u>Botaurus lentiginosus</u>)
	Black tern	(<u>Chlidonis niger</u>)
	Least bittern	(<u>Ixobrychus exilis</u>)
	King rail	(<u>Rallus elegans</u>)
	Yellow-crowned night heron	(<u>Nycticorax violaceus</u>)
	Spotted turtle	(<u>Clemmys guttata</u>)
	Western smooth green snake	(<u>Opheodrys vernalis</u>)
	Franklin's ground squirrel	(<u>Spermophilus franklini</u>)
	Blanding's turtle	(<u>Emydoidea blandingi</u>)
	Bald eagle	(<u>Haliaeetus leucocephalus</u>) *Historical

This endangered species list constitutes informal consultation only, and is not intended to fulfill the requirement of Section 7 of the Endangered Species Act of 1973, as amended. If, after review of the Phase I Remedial Investigation report, it appears likely that any endangered species may have been/may be affected by this site, it may be necessary to initiate formal consultation. If as a result of further consultation, a "no effect" determination is made regarding endangered species, that determination should be revisited after 1 year for new information, or newly listed species.

CONCLUSIONS

1. Wetlands identified on the NWI do exist at the American Chemical Services site.
2. There are wetlands present at the site that are not identified on the NWI. These wetlands consist of palustrine, forested, and scrub-shrub transitional zones between the NWI-identified emergent wetland and upland areas.

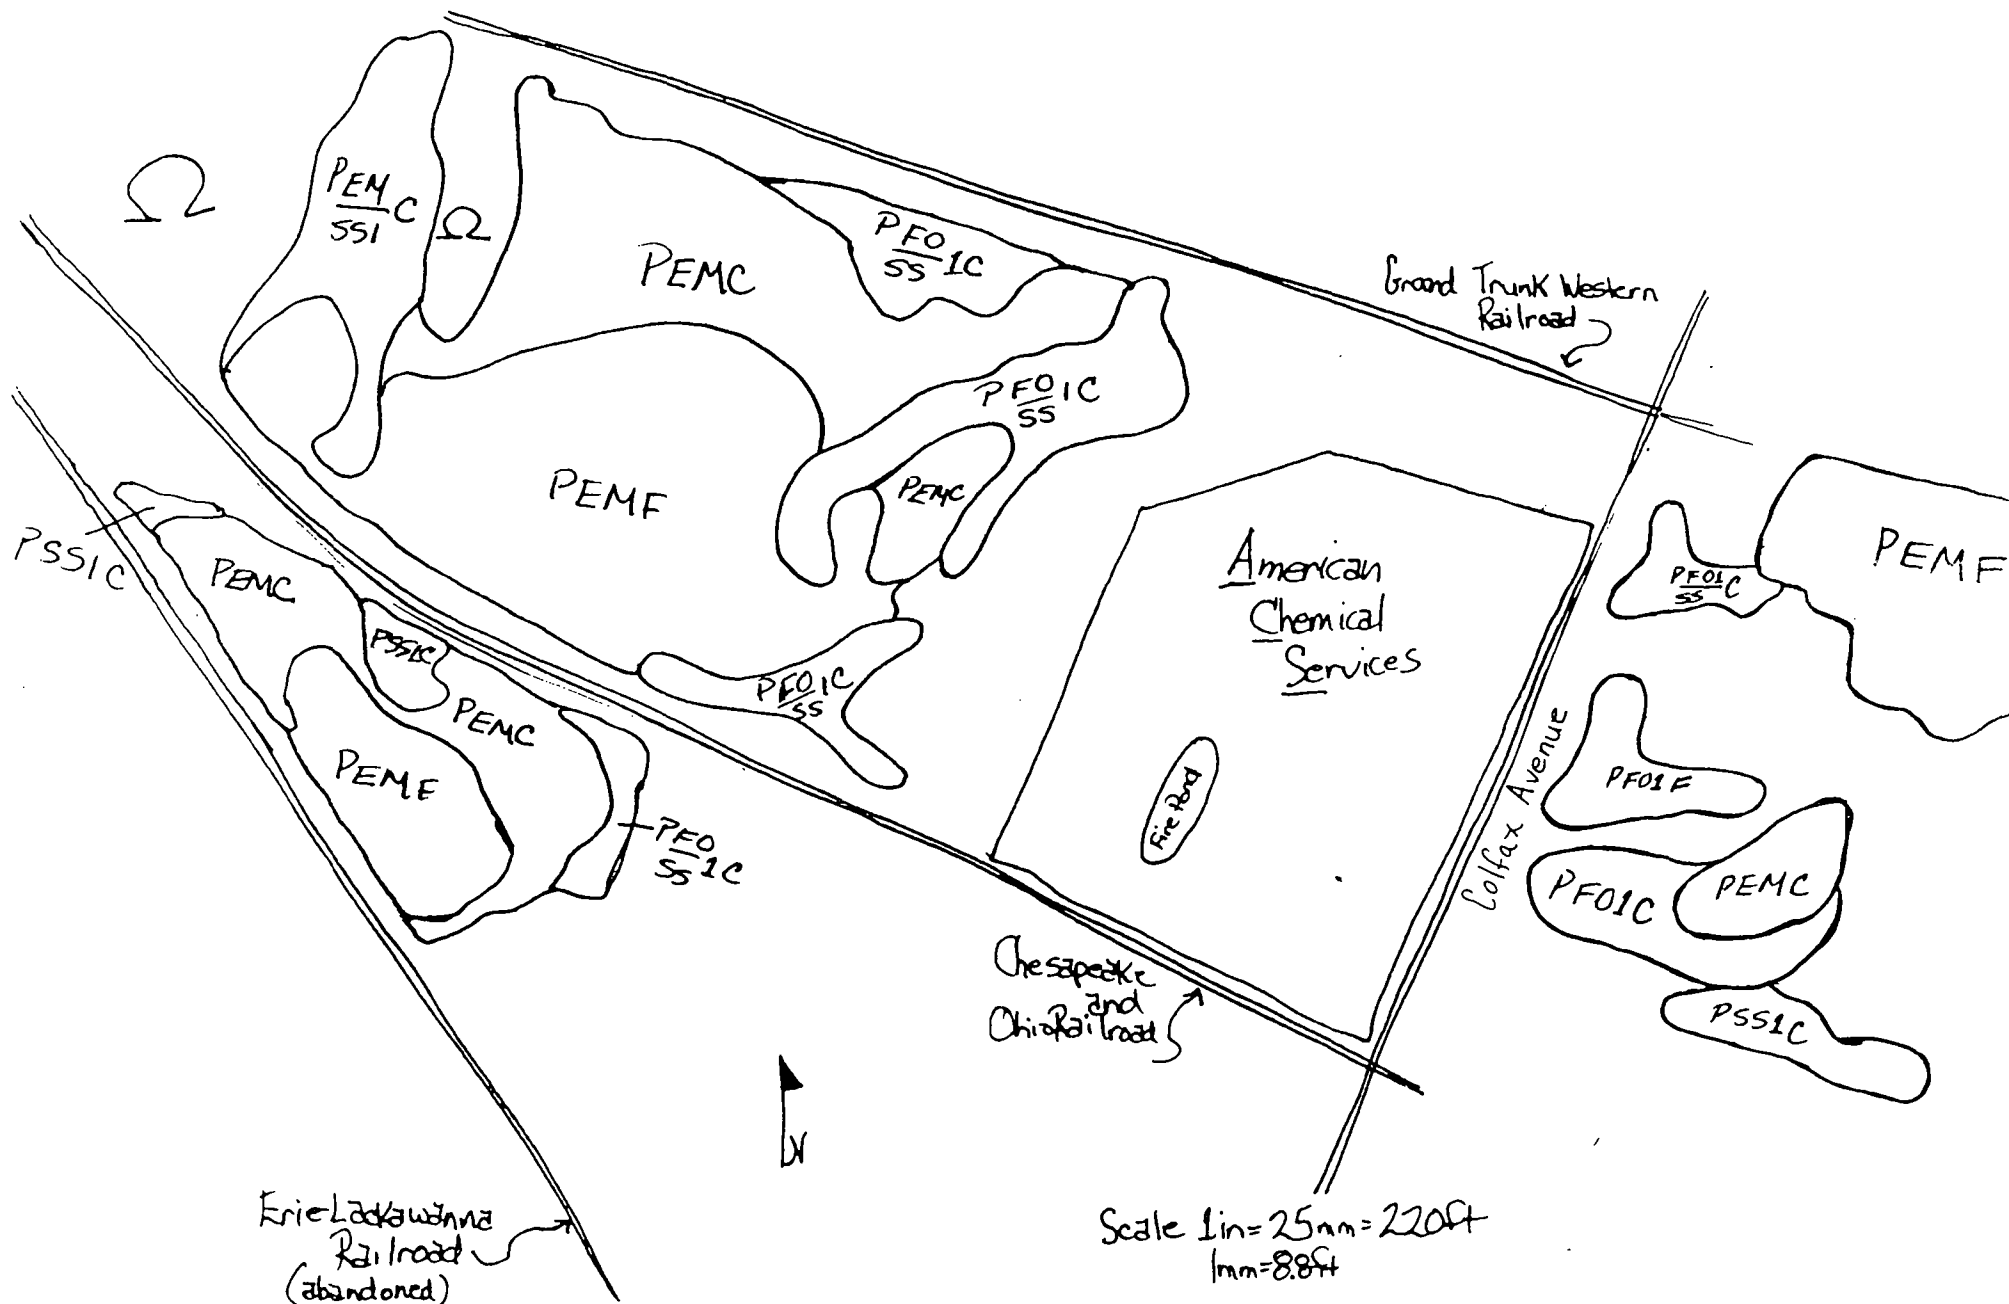

FIGURE 6. Approximate locations and classifications of additional wetlands located near the ACS site, east across Colfax Avenue, Griffith, Indiana.

3. The wetlands present at the site provide habitat diversity for a variety of wildlife species.
4. The wetlands present on the site possess potential habitat for federal threatened and endangered species, state and federal species of special concern/emphasis, and other birds protected by the Migratory Bird Treaty Act.
